EXECUTIVE SUMMARY | DUKA ELECTRONICS | H1 2026

BIG IDEA
Prioritise H2 inventory and marketing tests using branch/category performance, but validate stock, margin and costs before reallocating budget.

KEY FINDINGS
- H1 synthetic orders generated KES 52,464,100 across 1,000 orders (AOV KES 52,464).
- Mombasa led branch revenue at KES 8,180,000; Computing led category revenue at KES 25,513,000.
- 2026-06 was the strongest month (KES 11,002,100); 2026-02 was the weakest (KES 6,703,000).
- Welch test weekend minus weekday mean: KES -2,367 (95% CI -11,471 to 6,736; p=0.6097).

RECOMMENDATIONS
- Protect availability for the strongest revenue categories and audit stock-outs before placing H2 orders.
- Run a time-boxed, measurable branch marketing pilot with a holdout or baseline; compare incremental gross margin, not revenue alone.
- Investigate monthly peaks and troughs with promotion, stock and cost data before changing budgets.

BUSINESS IMPACT
Use the KES performance baseline to direct a measured 90-day inventory and marketing pilot; evaluate lift in gross margin and sell-through before scaling. Impact is a proposed measurement plan, not a forecast.

LIMITATIONS
All orders are synthetic and generated for teaching. Costs, inventory, promotions and customer cohorts are absent. Results are descriptive; weekday/weekend test assumptions and repeated product/branch comparisons limit inference. No causal or real-business conclusions are warranted.
